SQL Practice Questions

Based on the Customers Dataset — 40 Questions

Assume the data is loaded into a table named **customers** with the following columns:

```
customers (
  CustomerID, Name, Age, Gender, City, Email,
  Phone, AnnualIncome_INR, SpendingScore, JoinDate
)
```

A. ORDER BY

1. List all customers sorted by Age in ascending order.
2. Show all customers sorted by AnnualIncome_INR in descending order.
3. Display customer Name and City, sorted alphabetically by City.
4. Sort all customers by SpendingScore from highest to lowest.
5. List customers ordered by JoinDate, oldest join date first.
6. Show Name, Gender, and Age, sorted first by Gender and then by Age descending.

B. SELECT / WHERE / ORDER BY / LIMIT

7. Find the top 5 customers with the highest AnnualIncome_INR.
8. Get the 3 youngest customers from the city of Delhi.
9. Select the top 10 customers by SpendingScore where Gender = 'Female'.
10. Find the 5 most recently joined customers (JoinDate).
11. Get the top 5 highest-earning male customers.
12. List the 3 oldest customers whose SpendingScore is above 50.

C. DISTINCT

13. Find all distinct City values in the table.
14. Get the distinct Gender values present in the dataset.
15. Find the number of distinct cities customers belong to.
16. List distinct combinations of City and Gender.
17. Find distinct Age values among customers with SpendingScore greater than 70.
18. Get the distinct JoinDate years customers registered in (hint: extract year from JoinDate).

D. Aggregate / Evaluation Functions

19. Find the average Age of all customers.

20. Find the maximum and minimum AnnualIncome_INR in the dataset.

21. Count the total number of customers.

22. Find the average SpendingScore of all customers.

23. Find the sum of AnnualIncome_INR across all customers.

24. Count how many customers have a SpendingScore greater than 80.

E. Aggregate Functions + GROUP BY

25. Find the average SpendingScore for each City.

26. Count the number of customers in each City.

27. Find the average AnnualIncome_INR grouped by Gender.

28. Find the maximum Age in each City.

29. Find the total number of customers per Gender, sorted by count descending.

30. Find cities having more than 3 customers, along with their average AnnualIncome_INR (use GROUP BY + HAVING).

F. Combined: SELECT + WHERE + DISTINCT + ORDER BY + LIMIT

31. Find the distinct City values, sorted alphabetically.

32. Get distinct Gender values for customers older than 30, sorted alphabetically.

33. Find the top 5 distinct City names among customers with SpendingScore above 60.

34. List distinct Age values for Female customers, sorted from youngest to oldest, limited to the first 5.

35. Find the 3 highest distinct AnnualIncome_INR values among customers from Mumbai.

36. Get distinct cities where at least one customer has SpendingScore greater than 90, sorted by city name, limited to top 5.

37. Find the top 3 distinct JoinDate years among customers with AnnualIncome_INR above 1,000,000.

38. List distinct Gender and City combinations for customers aged between 25 and 40, sorted by City, limited to 10 rows.

39. Find the 5 distinct highest SpendingScore values recorded among Male customers, sorted descending.

40. Get distinct City names for customers who joined after 2024-01-01, sorted by number of matching customers, limited to top 5.
